

Volcano Technique Vaporizers

The volcano vaporizers are thought to be newest in the vaporizer stream. It was developed in late nineties. Only main facility provided by this is freedom to move while inhaling the vapors. It is done with the help of its disintegrative balloons. These balloons when filled with mist can be carried along for inhaling. These particular balloons can be used as cigarettes are used with ease. Thorough inhaling of the vapors can be done through the vent of balloon without taking care of the burning process done in the vaporizers.

Instead of burning the plant material or herbs in vaporizer very hot air is blown on the herb to extract vapors. The hot air travels through an aluminum pipe and then targeted on the disk on which the material is placed. So the temperature generated by hot air the material releases the vapors. The special material pump and dispenser are present in the volcano vaporizer which helps in balloon filling without any effort by the user, because of this ease given by vaporizer user just sits and watch the balloon to fill and enjoys the vapors. Because this vaporizer works on a different principle the herbs are treated in a manner that minimum residue is left and maximum vapors are produced. This type of vaporizers is medically approved and it fetches the vapors without the combustion process. Some other advantage of this type is that it works on sub combustion temperatures so the user is always safe from the pollutants and other agents of smoking and this vaporizer is rapid extractor of vapors and reduces toxic combustion of herbs.

Its working mechanism consists of two hot air producers and different valves for different combustion level and if user needs quick combustion all the valves are opened and if slow combustion is needed only single valve is opened. This all depends on the user choice and taste that there should be slow or quick combustion and this option is only present in these vaporizers. Very large display present at the front of vaporizer is of great use which informs all the information to the user from combustion completion to balloon filling and the material used in this vaporizer is all food safe and the balloon used for storage of vapors is transparent high quality polythene. Drug user can see while the mist is being produced and can taste that when ever he wants. These parts of the vaporizer are specially designed to withstand the heat and pressure produced during the whole process. And it is also equipped with an air filter, temperature control fuse and a silencer to make smooth vaporization process. Also in some rare cases the plant material is not properly extracted and some contents are left with.
