

Edegra : The Choice of Men

For many men suffering from ED, Edegra enables response to sexual stimulation. When a man becomes sexually aroused, the blood carrying arteries in the penis expand and widen allowing a greater amount of blood flow into the penis. As the arteries in the penis expand and harden, the veins that carry blood away from the penis become compressed, restricting blood flow out of the penis. An erection takes place as more blood is flowing into the penis and less blood is flowing out.

As any complications with the nerves or blood vessels involved with an erection may result in Erectile Dysfunction, Edegra increases blood flow to the penis resulting in a solid erection. The erection softens when the sexual encounter goes away.

Edegra does not automatically cause an erection. One must be sexually stimulated first to get an erection. Edegra is not a hormone and is not an aphrodisiac. Edegra is a prescription medication designed to improve erectile function and allow most men to improve erection problems.

Edegra dosages should not be taken more than once per day and it is only for men with ED. It is not to be taken by children or women. The consumption of alcoholic beverages can temporarily impair the ability to get a keep a sustained erection. To achieve maximum results while using Edegra, one should not drink large amounts of alcohol before taking the medication.

One may take Edegra after a meal, but he should restrain from eating meals high in saturated fat like hamburgers and French fries. Fatty food may cause the medication to take longer to start working and achieving the desired results.
